

# Which GST provider should I use?

**Use Karza (now part of Perfios)**

## Why Karza is suitable

- Its GST stack is purpose-built for lending and credit underwriting.
- Returns the exact signals the risk model needs: filing history (GSTR-1 / GSTR-3B), compliance gaps, cancellation/suspension and derived turnover - not just "is this GSTIN valid".
- Trusted by NBFCs and lenders, and handles the GSTN connection for us (no GSP licence or government contract).

## Why not the others

|                                                             |                                                                                           |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| <b>Clear (ClearTax)</b>                                     | More built for filing/compliance than credit signals - keep only as a backup.             |
| <b>Perfios (verification API)</b>                           | Fine, but use the Karza credit stack inside Perfios, not just plain verification.         |
| <b>Surepass</b>                                             | Thin on filing-history/compliance depth - okay for a cheap pilot, not for the real score. |
| <b>Signzy</b>                                               | A heavy end-to-end KYB flow - overkill for simple GSTIN credit lookups.                   |
| <b>Others (HyperVerge, Cashfree, Attestr, IDfy, BeFiSc)</b> | Only confirm a GSTIN is valid - too shallow for credit scoring.                           |
| <b>Govt GST Portal (direct)</b>                             | Needs a GSP licence (Rs 2-5 cr capital + GSTN contract) - kills launch speed.             |

**Bottom line: Karza (Perfios) is the only option that gives deep, credit-relevant GST data without a GSP licence. Build a swappable GstProvider interface so the others can be added later if needed.**
